Abstract

1. **Our model of cognizing** roots in developmental psychology by Jean Piaget, follows researchers in modeling cognizing by solvers of combinatorial games, enriches object-oriented representatives of realities by input classifiers and relationships in English, while tends to be consistent with questioning the origination of cognizing in nature. Let us introduce the basics of the model, provide arguments for its adequacy, followed by those supporting the origination of cognizing.

2. **Interpreting Piaget** (Flavell 1962), *human cognizers* are defined as realities over *energizers* that in collaboration with analogous cognizers of members in their communities *learn* and organize *mental systems* for preserving their personal and community utilities.

Energizers are interpreted as realities attributed to the ability to gain energy from any sources to preserve certain utilities, especially ones for diversified reproducibility of energizers.

Mental systems (mss) are identified by their *doings* either *inherited*, or *learned* both *by revelation* and *acquisition* of mss with and from communities C.

Revelation /discovery/ is assumed to be goal oriented, thus, *motivated*, and includes *doings of inductive, deductive, imaginary and intuitive inferring of mss, enhancement of effectiveness of mss, processing mss to search or prognosticate classifiers and strategies*.

Effectiveness of mss can be raised by *cellular or constructive regularizing, constructive and adequate modeling*, others.

Acquisition assumes gaining mss straightly from teachers or throw *representations of mss*.

2.1. Humans, as a type of cellular realities, *cellulars*, include *roots* or inherited utilities, which humans enrich with new ones throughout their lifetime. Roots, sensors of all over, effectors to figure out our doings, overall controllers and some others embrace the *octaves* of our cognizing. Sensors in conjunction with other classifiers either inherited or studied and identified in a lifetime, i.e., revealed, but mostly acquired from the cultures of communities, comprise our *attributes*.

2.2. The outputs of attributes entail *imprints* in each member $x@C$. The members x of C classifying imprints represent their causers, particularly those caused by the impacts of causers on the utilities of x .

2.2.1. The imprints, their causers and classifiers are *realities of $x@C$* , while the totalities of realities of x comprise *the observable Universe of x, xU* .

2.3. *Doers*, generally, are realities having input-output parts, and for realities on the input parts, that are not necessarily pre-classified, either elaborate certain output realities or remain passive.

(Note, that in/outputs of doers are arbitrary realities, which distinguish them from those of operators in physics).

2.3.1. In-realities causing elaboration of output realities and the totalities of these out- realities comprise *in- out- domains*, or *in- out-doms* of doers, correspondingly.

Indoms with regards to outputs are split into classes of equality, thus, the absence of outputs, i.e., the absence of activation of doers, corresponds to the *class (?) of uncertain in-realities*.

2.3.2. Doers are *do-classifiers* Cl if indoms are split into two classes +Cl and ?Cl; otherwise they are *corresponders, cors*. Classifiers of n-tuples of nominals are *n-place relationships*.

3. *Generalized cognizers* are defined as realities with energizers and certain utilities that throughout their lifetime regularly and unlimitedly learn and organize certain constructions, *mentals*, to promote their utilities..

3.1. The definition of *mentals* (generally exempted from cellular and computer dependency) is incremental and is based on those of doers, sensors, classifiers, relationships, attributes, imprints, identifiers, nominals, doins, systems over nominals and others (Pogossian 2020-23).

Particularly, doins (or *doers over IDs of nominated realities*) are interpreted as algorithms that as inputs use IDs of imprints and IDs of algorithms either innate or learned.

For example, the projection of doins to OOP corresponds to the algorithms that as inputs use either IDs of basic types (integers, symbols, etc.), or IDs of other algorithms encapsulated in abstract classes, while mss correspond to systems of abstract classes incrementally ascended from ad

hoc available ones by *attributing*, *parenting* and *do* types of relationships, interpreted as *have*, *be* and *do* (hbd) ones. Mentals in addition to *hbd* are enriched by English relationships that are capable to be formed by revelation algorithms (inductors (Pogossian 1983)) analogous to those of formation of 1-place classifiers, say by neuron nets (NN) (Pogossian 2020-23).

4. In the problem HU^* of *cognizing the entire Universe* U^* it is required to construct generalized cognizers (cogs) effectively promoting their utilities in the U^* .

5. **Justification of cognizers as adequate models** of cognizing tends to be carried out by analogy with justification of algorithms as adequate models of computability by Church.

5.1. Particularly, the adequacy of mentals, at first, should be proven for several mss, then, a hypothesis h on adequacy of mentals to any mss should be declared to be examined empirically until h is refuted by some mss.

Ideally, this justification means that for the original problem HU^* , for systemic classifiers sC_{lm} of any mss m of any $x@C$ solving HU^* might be possible to provide mentals m' with classifier sC_{lm}' equal to sC_{lm} .

5.1.1. Realistically, since the adequacy of mentals can be examined only for a finite number of mss it is worth examining h , first of all, for the selected key mss.

As such key mss we select meta mss, i.e., those doing over mss, then ones acknowledged by psychologists and psychotherapists as a nucleus for identifying the norms of being humans.

5.1.2. The next barrier in justifying the adequacy of mentals is the incredibility of the HU^* problem in examining the equality of mentals to the target mss.

Ideally, to prove adequacy of mentals m' for target mss m , we should confirm equality of m and m' for any type of their relevant processing for any tasks of HU^* problem, which is unrealistic.

5.1.3. To overcome this barrier, we follow the views that the HU^* problem can be approximated by game models (Bergji 1969, Pogossian 1983, Laird 1987). Then, we argue that combinatorial games with known hierarchies of utilities and solutions in spaces of possible strategies of game trees can represent the HU^* problem with a proper adequacy (Pogossian 2020).

5.2. Arguing the adequacy of our models of cognizing we state that the models

-are completely explainable

-preserve the majority of known statements and algorithms of cognizing including

= inductive learning algorithms, particularly in the NN mode,

= Personalized Planning/ Integrative Testing algorithms elaborating strategies in target situations dependent on the learned classifiers, thus, elaborating "if then" relationships - the base for formation algorithms, say, by A. Markov or E. Post (Pogossian 2020-23),

=algorithms of acquisition of strategy meanings by experts and those from the texts (Pogossian 2020, Grigoryan 2021) conceptually close to (Langley, Shrobe, Katz, 2020),

-provide expert like explanations/interpretations of mentals - can be based on any classifiers, say on NN ones, thus, consisting functional and connectivity models of cognizing - successfully approximate expert solutions of security, competition and dialogue HU^* case-problems (Pogossian 2020)

-are supportive to revelation of origination of cognizing.

5.3. Note, that illuminative advances of generative pre-trained transformer BERT, Chat GPT, etc., question their positioning concerning the human like cognizing and possible integration with their models. Assuming that humans inherit classifiers, then entire lifetime accumulate imprints and classifiers caused by realities, while intuitive reasoning relies on these stores, it is challenging to reveal, whether such chatbots, which, in fact, are able to accumulate the entire records of imprints and classifiers of humans, can be adequate models of human intuition?

6. **Questioning origination of cognizing** (Pogossian 2020-23) should, first of all, turn to the origination of cognizing of living realities, i.e., cellular, and, as a minimum, of the simplest cellular, uncials.

6.1. By one of the prevalent hypotheses, *abiogenesis*, uncials, were originated by chance from chemical compounds already existed in nature. Unfortunately, despite of ongoing intensive research efforts, abiogenesis holds more difficulties and hopes than advances (Irreducible complexity).

6.1.2. Some physicists and philosophers argue our living in a simulated world (Bostrom 2003), others succeed in the anthropic principle (Fine-tuned universe) stating that "...if the dimensionless physical constants had sufficiently different values, our Universe would be so radically different that intelligent life would probably not have emerged, and that our Universe therefore seems to be fine-tuned for intelligent life".

6.1.3. The followers of intelligent design (Dembski 2007) also reject incremental, evolutionary appearances even though uncials providing "...two main arguments against evolutionary explanations: irreducible complexity and specified complexity, asserting that certain biological and informational features of living things are too complex to be the result of appearance by chance and natural selection".

6.2. Consequently, the followers of intelligent design and anthropic principle conclude that cellular were designed by a creator, God and postulate its existence in nature forever.

Paul Dirac (2007) more carefully reasons about God setting up the connection between the existence of a God and the physical laws assuming that "... if physical laws are such that to start off life involves an excessively small chance so that it will not be reasonable to suppose that life would have started just by blind chance, then there must be a god, and such a god would probably be showing his influence in the quantum jumps which are taking place later on".

6.3. Unfortunately, the assumptions on the existence of God unavoidably cause another even more difficult question on how such a sophisticatedly complex creator as God could appear in the Universe.

Such declarative postulating of God, unfortunately, provides only suitable interpretations of events without any of their reproducibility and predictive power.

Let us acknowledge also that contemporary physics also grounded on postulates including those on the primordial existence of energy, fields and the Universe itself.

Nevertheless, these postulates radically differ from one of all ever-existed God because are supported by an overwhelming amount of reproducible expertise and by cause-effect chained assertions tidily united into prognosticable theories.

6.4. While studies on abiogenesis continue, new ideas and hypotheses on the origin of uncial emerge attempting to exempt from the difficulties of abiogenesis.

By the hypothesis on *origin-able cognizing in nature* (oacin), arisen in constructive modeling of cognizing, cellulars were designed by a type of cognizers of the Universe which -were earlier originated in nature as elementary recurrent classifiers, then -evolving had attained the power of cognizing comparable, at least, to the highest human one, followed by -designing cellular, analogous to human design of robots nowadays.

6.5. Viability of oacin hypothesis is strengthened by assertions that

- constructions, *mentals*, adequately model mss -mss and means of their construction can be composed of elementary “atoms”, *recurrent 1/2- place classifiers* -a type of constructive cognizers, *octaves*, exempted, generally, from computer dependencies and capable of enhancing the power of cognizing throw learning mentals, but so far limited in that, can adequately model cognitive development of newborns by Piaget

- octaves, and assumingly their roots, *can be reduced* to some alphabet of uniform units, i.e., inevitable constituents of cognizers

- studying the origination of octaves/ roots can be based on studying the origination of their constituents - functional definition of constituents of octaves/roots softens the requirements to their implementations .

7. Thus, **upcoming research** in the origination of cognizers reduce, particularly, to origination of the dynamicity of doers, energizers and their ability to develop to octaves and other unavoidable constituents including -carriers of and compartments for constituents of cognizers - doers of the types of 1/2place symbolic and non-symbolic recurrent classifiers (possibly represented firstly as case based *g/gg*-matrices) and comprising case based nets *Ncb* - *Ncb* searchers of strategies equal to symbolic and non-symbolic procedures that ---compose the variety of doers into energizers. ---compose case-based *g/gg*-matrices into *rule-based*

1/2place classifiers and their rule based nets *Nrb* - *Nrb* searchers of strategies equal to algorithms, as well as to the fundamental question of the -reproducers of constituents and their compositions including themselves.

7.1. These studies along with enriching applications of current cognizing models, if successful, will support to shed light on the fundamental question of the origin of cellular, and thus, of humans.
