

efit scenarios where additional evidence is available from highly-connected networks that can help improve keyphrase extraction. Examples of such scenarios include papers from domains other than Computer Science, e.g., Biology and Chemistry, webpages or images on the Web (where the anchor texts pointing to a webpage or to an image act as “citation contexts”). In future, we plan to extend and evaluate CTR for these other types of documents.

Acknowledgments. This material is based on work supported by a grant from the National Science Foundation.
